

VITANOL®

**A BIOLOGICAL WAKE-UP
FOR DEVITALIZED SKIN**

The reduction of cell metabolism and of synthesis abilities caused by aging mechanisms result in wrinkles, slack skin and a loss of radiance.

In the battle against skin aging, retinol is a reference ingredient, recommended for its repair abilities, but its use shows too often problems like instability and skin irritation.

In order to get around these problems, Silab has developed VITANOL®, an effective retinol-like active ingredient that is stable and safe.

VITANOL® is rich in galactomannans and boosts cellular activities that are disturbed during the aging process. It favors the renewal of the epidermis by regulating keratinocyte differentiation. It protects and repairs the dermis by stimulating the synthesis of collagen I and by reducing the activity of metalloproteinases responsible for elastic fiber destruction.

The revitalized skin is once again radiant, the barrier function is restored and wrinkles are attenuated.

VITANOL® sustains the comparison with retinol. It is therefore recommended for all types of anti-age prevention and treatment care.
